

PAINT-COATED COMPONENTS

ABSTRACT OF THE DISCLOSURE

5 A dual-bearing reel component, whose obverse face is paint-coated, is furnished with: a base element, a ground coating formed by painting on an obverse-layer side of the base element, and a metallic coating layer having a mirroring effect and formed semitransparently on an obverse-layer side of the ground coating. The paint-coated component of the present invention improves the design of paint-coated components in their outward look.
